Corporate Profile

Hydro-Québec is a leading producer of energy and a major North American distributor. Its generating facilities have an installed capacity of 31,174 MW, and it uses water power to produce 96% of its total output. Its system includes 32,273 km of transmission lines and 106,448 km of distribution lines, approximately 9,000 km of which run underground. Its core mission is to supply Quebecers with sufficient electricity to meet their needs, under the best possible conditions. Hydro-Québec also does business with numerous electric utilities in the north-eastern United States, Ontario and New Brunswick, related mainly to short-term electricity sales and purchases. These transactions increase the security of its own electricity supply while also generating additional revenue. Hydro-Québec is known worldwide for its expertise, particularly in the areas of hydroelectric generation and high-voltage transmission. It maintains an active presence abroad, where it owns, builds or operates facilities in South America, Australia, the United States and China, among other places. Hydro-Québec has a single shareholder, the Québec government.

Sales continued to grow, topping \$12 billion in 2001. Increased electricity transactions in the U.S. and electricity transmission revenue from recent investments outside Canada contributed to this growth.

In line with its profitability objectives, Hydro-Québec continued to improve its financial position. Net income increased by \$30 million to reach \$1.1 billion and return on equity stood at 7.6%.

In the past five years, Hydro-Québec has paid its shareholder over \$2 billion in dividends, while increasing its capitalization rate.

Steady growth in Hydro-Québec's profitability is the most effective way of keeping Québec electricity rates among the lowest in North America.

Jacques Laurent
Chairman of the Board of Directors

André Caillé
President and Chief Executive Officer

SUSTAINED GROWTH

In 2001, Hydro-Québec steered a steady course toward the objectives set out in its Strategic Plan, in particular by constantly offering its customers improved products and services. Altogether, Hydro-Québec's operations generated consolidated net income of \$1,108 million, up 2.8% over last year. This excellent result is mainly attributable to an increased volume of transactions outside Québec, especially purchase/resale operations on the North American spot market, and the stability of financial expenses. The drop in short-term interest rates, as well as long-term refinancing at more advantageous rates, helped offset the negative impact of the weak Canadian dollar on our U.S.-dollar debt.

Transmission income grew substantially, in part because the operating results of Hydro-Québec TransÉnergie's international subsidiaries Transelec, in Chile, and Consorcio TransMantaro, in Peru, have been included in the 2001 financial statements. The increase also stems, to a lesser extent, from the operation of the DirectLink project in Australia.

Hydro-Québec intends to continue improving its profitability. For the company, this goal represents an important commitment to Québec as a whole. Its activities, both at home and abroad, benefit all Quebecers, whether in the form of direct and indirect economic spinoffs in all regions of the province, dividends paid to the Québec government, which uses them to meet Quebecers' needs, or ongoing improvements to its infrastructure and services.

A REVITALIZED COMPANY

A highlight of 2001 was the establishment of a new organizational structure. The deintegration of the company into four divisions, each headed by a president, fits in with the new regulatory framework governing the North American power industry. The four divisions are Hydro-Québec Distribution, Hydro-Québec TransÉnergie, established in 1997, Hydro-Québec Production and Hydro-Québec Ingénierie, approvisionnement et construction.

Hydro-Québec's new structure enables the company to adapt to current market conditions. It promotes the concentration of leading-edge expertise in each of the divisions, and gives them the necessary flexibility to adjust to their particular business environments. This structure also allows the divisions to seize growth opportunities in their respective markets and affords them full control over the services they offer, ultimately optimizing their results. Other components of the organization are Hydro-Québec's research institute as well as subsidiaries and affiliates operating in specific sectors.

Administrative and support functions are now grouped together under Corporate Management. We are confident that this new organization will help improve the quality and continuity of our services, while also supporting the profitable growth of a collective heritage that benefits all Quebecers.

A NEW DIVISION OF RESPONSIBILITIES

In 2001, Hydro-Québec made the provisions arising from Québec's energy regulations an integral part of its operations. Hydro-Québec Distribution is now responsible for supplying power to Québec customers. To fulfill this responsibility, the division purchases a heritage pool of 165 TWh/year from Hydro-Québec Production, at a regulated fixed price of 2.79 cents per kilowatthour. This volume forms the long-term core of Québec's electricity supply. It should be stressed that this is the lowest rate in North America for such a large quantity of power. Beyond this annual volume, Hydro-Québec Distribution must supply its Québec customers by issuing calls for tenders from suppliers on the marketplace. Hydro-Québec Production may respond to these calls for tenders.

In July 2001, the Régie de l'énergie (Energy Board) approved the *Code of Ethics on Conducting Calls for Tenders* to meet the native load beyond the heritage pool. Hydro-Québec Distribution then filed its first Electricity Supply Plan, designed to meet the portion of demand that will exceed the heritage pool by 2006 or 2007, as well as an application to issue a call for tenders in 2002.

SLOW GROWTH IN DEMAND

After averaging 2.7% a year between 1986 and 2001, growth in electricity demand should shrink to an annual rate of 1.2% over the next 15 years. This fall-off will stem from Québec's slow population growth and the development of a post-industrial economy—in other words, one that is energy-efficient, diversified and composed, to a large degree, of New Economy businesses.

In the medium range, looking toward 2006–2007, Québec's annual electricity demand could reach 167.2 TWh. This forecast is based on a scenario that includes energy conservation. Over the years, Hydro-Québec has implemented various programs for reducing energy consumption in all its customer categories, and in 2002 it will submit its Energy Efficiency Plan, focusing on energy conservation, to the Régie de l'énergie. The demand forecast also takes into account the economic downturn that began in early 2001, the extent and duration of which have become even harder to assess since the events of September 11 in the United States.

INCREASED GENERATING CAPACITY

The forecasts for growth in Québec demand, as well as new and profitable business opportunities in northeastern North America, have prompted Hydro-Québec Production to increase its generating capacity and to continue promoting the development of Québec's hydropower potential.

As a result, Hydro-Québec Production has initiated a number of projects. The division started work on a hydroelectric generating station on the Toulnostouc River. It obtained government authorization for the partial diversion of the Portneuf and Sault aux Cochons rivers to the Bersimis complex in order to optimize the output from the Bersimis generating facilities. In May 2001, it tabled a draft design report for the construction of Mercier hydroelectric station on the Gatineau River. In addition, draft design studies for a hydropower development to be built on the Péribonka River, north of Lac Saint-Jean, got under way.

The final decision on the plan to partially divert the Manouane River is expected in spring 2002. The project to rebuild the dam and dikes at Rapides-des-Quinze generating station was approved by the authorities concerned. Rehabilitation and upgrading work designed to ensure the long-term operability of our generating facilities also went ahead. In other projects, we broke ground on the new Grand-Mère hydroelectric plant and completed construction of Sainte-Marguerite-3 generating station. Finally, new agreements with the Crees will allow Hydro-Québec to construct Eastmain-1 hydroelectric generating station, and undertake draft design studies for Eastmain-1-A generating station and the partial diversion of the Rupert River.

Hydro-Québec Production still favors the hydropower option. However, the lengthy process of obtaining the necessary authorizations and then building hydroelectric generating stations does not allow such facilities to be commissioned in time to meet the demand forecast for 2005–2006 onward. Hydro-Québec has therefore decided to construct a gas-fired thermal generating station, the Suroît project, on property it owns next to the Beauharnois Canal. This combined-cycle power plant, which will have a capacity of approximately 800 MW and average annual output of 6.5 TWh, will use one of the most efficient thermal technologies available. It will help diversify the company's sources of supply and will provide additional capacity starting in the winter of 2006–2007.

Besides increasing its own generating capacity, Hydro-Québec Production may purchase electricity from independent power producers in Québec and on regional markets in northeastern North America to diversify its sources of supply. This practice assures the division of having the energy it needs to meet its commitments and take part in market growth.

A RELIABLE TRANSMISSION PROVIDER

To deliver power to its customers, Hydro-Québec relies on the Hydro-Québec TransÉnergie transmission system, which measures up to some of the most stringent strength and reliability standards in the North American industry. Much of the loop work planned following the ice storm of 1998 has been completed. In the event of a major power failure, most of the especially vulnerable regions will consequently have access to another supply source. As well, Hydro-Québec TransÉnergie still intends to build a 1,250-MW interconnection with Ontario, provided that the conditions allow for a reasonable return on its investment.

The deregulation of the transmission market means that the division now manages a large volume of power flows to and from neighboring systems, independent power producers and Hydro-Québec Distribution, resulting in further revenue for the company. Hydro-Québec TransÉnergie submitted an application to amend its transmission rates at public hearings held by the Régie de l'énergie. The Régie will hand down its decision in 2002.

Hydro-Québec TransÉnergie spearheads Hydro-Québec's activities on the international scene. Its expertise in the area of high-voltage transmission is in great demand. In 2001, the division was already involved in a number of major projects in Chile, Peru, Australia and the United States, among other countries, and it pursued its efforts at profitable development by promoting less capital-intensive projects.

RENOWNED EXPERTISE AND SERVICES

To carry out its projects, the company relies on the expertise and services of Hydro-Québec Ingénierie, approvisionnement et construction, its engineering division, which has developed unique know-how over the years, particularly in the design and construction of large-scale generation and high-voltage transmission facilities.

GREATER MOTIVATION

The results posted in 2001 are the product of greater employee motivation throughout the company. As the year comes to a close, we wish to thank all those who have enabled us to better fulfill our mission, to improve the quality of our services and to increase our profitability.

At the conclusion of 2001, Hydro-Québec is resolutely engaged in making changes in order to keep serving its customers well and continue growing in a fast-evolving industry.

To ensure its future, however, Hydro-Québec will have to meet a major challenge. It must hire and train a new generation of employees to carry on and improve the often unique expertise developed by our personnel in a variety of critical sectors. We fervently hope that this succession, which will be made up mainly of young graduates in all fields, will enable the company to continue its progress. Lastly, we hope these new recruits will find with us a stable, stimulating environment in which to deploy their talents.

Jacques Laurent
Chairman of the Board of Directors

André Caillé
President and Chief Executive Officer

“Hydro-Québec Distribution continues to focus on improving system reliability and maintaining service quality in line with its customers’ priority expectations.”

— Yves Filion, President
Hydro-Québec Distribution

THE DIVISION'S 7,388 EMPLOYEES ARE RESPONSIBLE FOR ELECTRICITY SERVICE TO 2.8 MILLION QUÉBEC CUSTOMERS. THEY DO THEIR UTMOST TO RESTORE SERVICE AS QUICKLY AS POSSIBLE IN THE EVENT OF A POWER FAILURE.

the Distributor

power to the people

Reliable Power and Improved Service

The primary responsibility of Hydro-Québec Distribution is to supply Québec customers with the electricity they need. The division serves its approximately 2.8 million customers via a system of over 106,000 km of distribution lines, some 9,000 km of them underground. ■ In spite of Québec's often difficult weather conditions and the fact that our customers are spread over a huge 1.7-million-km² territory, service quality continued to improve in 2001. This was reflected in an increase in the overall rate of customer satisfaction from 7.22 out of 10 in 2000 to 7.33 in 2001. ■ Québec's electricity rates have not changed since 1998, and will remain at the same level until at least April 2004. In the meantime, Hydro-Québec will file a rate amendment application with the Régie de l'énergie. Any increases will be based on the rate of inflation and must allow the price of electricity in Québec to remain competitive. Access to affordable electricity is a major asset for the province's economy, and also contributes to the quality of life of all Quebecers. ■ Following a new analysis of its markets' energy conservation potential, Hydro-Québec Distribution will submit a three-year Energy Efficiency Plan to the Régie de l'énergie in 2002. According to an initial estimate, new measures implemented across the entire customer base could generate 400 GWh of new energy savings by 2006, on top of the 2,500 GWh of energy savings already achieved during the 1990s.

Yves Filion
President
Hydro-Québec Distribution

SUPPLY

A fundamental component of Hydro-Québec Distribution's mission is to supply Quebecers with electric power. Under the *Act to amend the Act respecting the Régie de l'énergie*, adopted by the Québec government in June 2000, Hydro-Québec Production must make 165 TWh available to Hydro-Québec Distribution for meeting domestic demand. Beyond that volume, Hydro-Québec Distribution must issue calls for tenders at regular intervals to all interested power producers, including Hydro-Québec Production. This will open up the province's wholesale market to competition.

- An initial Electricity Supply Plan to meet anticipated domestic power needs over the next 10 years was filed with the Régie.
- The division filed an application to launch an initial call for tenders in 2002 to meet additional anticipated needs in Québec starting in 2006–2007. This call for tenders is for 600 MW of capacity, which represents 4.1 TWh of energy annually.
- The Régie approved the *Code of Ethics on Conducting Calls for Tenders* guaranteeing fairness and impartiality in the awarding of supply contracts.

Comparative Index of Electricity Prices, Residential Customers—May 1, 2001*
(Montréal = 100)

* Monthly bill (before taxes) for a consumption of 1,000 kWh.

Services

Hydro-Québec Distribution offers its customers products, services and technology-based solutions that fit their changing needs. The division handles customer requests from its *HydroDirect* call centre locations in different parts of the province. It also promotes various energy conservation projects as a way of managing demand in Québec. It introduced an information and discussion process with the groups concerned, in preparation for tabling its Energy Efficiency Plan in 2002.

Residential customers

- The division continued its efforts to improve response speed and reliability at the *HydroDirect* call centres.
- It also continued its collection efforts to limit financial losses from overdue accounts.
- A task force made up of representatives of Hydro-Québec and consumer associations continued its activities with a view to developing lasting solutions to assist the most economically disadvantaged customers.
- The range of high-quality products offered to customers, such as sales and rentals of water heaters, air conditioners and heating systems, was expanded.

Business customers

- Special representatives were designated for certain groups of business customers to personalize the services offered.
- Remote-reading meters were installed at business customers' premises. Customers with multiple bills can group them and choose their own billing date.
- The Régie approved Phase II of the Electrotechnology Implementation Support program, run by the Shawinigan laboratory of Hydro-Québec's research institute.
- Members of Senior Management met with close to 2,000 business customers to become better acquainted with their needs and inform them about the services available.

E-commerce

- Hydro-Québec's Web site was enhanced to allow customers of all categories to send change-of-address notices and meter readings, and to view and pay their electricity bills.

Service Quality	2001	2000	Change
Rate of new hookups on schedule	93%	88%	▲ 5%
Rate of meter reading	96%	96%	—
Rate of call response in under 20 seconds			
— Residential customers	66%	59%	▲ 7%
— Business customers	69%	62%	▲ 7%
Average hours of service interruption per customer—gross	4.30	3.20	▼ 34%
Average hours of service interruption per customer—adjusted	2.62	2.33	▼ 12%

Customers can reach us easily thanks to the *HydroDirect* call centres.

Large-power customers

Our large-power customers are industrial, commercial and institutional organizations that require more than 5 MW of power. Low, stable electricity rates are incentives to set up or maintain operations in Québec. Hydro-Québec Distribution endeavors to continuously improve communications with these customers and stay attuned to their needs. The 258 companies in this category consume 43% of all electricity delivered in Québec.

- Total consumption by large-power customers grew compared with 2000, despite the economic slowdown. Sales in this sector amounted to nearly 64 TWh, generating revenue of more than \$2.2 billion.
- Communication with associations representing large-power customers increased.
- Work continued on implementation of a software platform providing large-power customers with continuous access to their daily consumption profile and other information of concern to them.
- The division made a firm commitment to large-power customers to maintain a business partnership based on quality and satisfaction, by offering them improved availability through one-stop access, a personalized business approach, high-quality power and real-time online communications, and by holding quality partnership sessions.
- The division filed for Régie approval of an emergency supply rate to meet the occasional needs of large customers.
- Networking activities were increased to encourage diversification in the Québec economy by attracting new business ventures, particularly in information technology and fibre optics.

Rate studies in industrialized countries show that Hydro-Québec's rates are among the most competitive.

Satisfaction Levels—Large-Power Customers

Comparative Index of Electricity Prices, Large-Power Customers—May 1, 2001*
(Montréal = 100)

* Monthly bill (before taxes) for a demand of 5 MW, a consumption of 3,060 MWh and a load factor of 85%.

Electricity service

Hydro-Québec Distribution has established an infrastructure along with a wide range of products and services for system planning, operation and maintenance that assure Quebecers of reliable, secure electricity delivery all year long. Its primary objective is to minimize the number and length of service interruptions. The division also aims to lessen the impact of extreme weather events by reinforcing its system. It works in close cooperation with municipalities to take the most appropriate measures to fulfill all its social and environmental responsibilities.

- Phase one of a program giving customers advance notice of any scheduled outage and informing them of the average service restoration time in case of a power failure was launched.
- Equipment maintenance programs have been implemented, making it easier to set priorities and conduct operations outside peak periods, in order to reduce the impact on customers and improve service continuity.
- Vegetation control operations were inventoried and agreements signed with property owners for the work to be done.
- A mobile transformer station was developed, allowing operations to be carried out on underground distribution lines without cutting off service to business customers.

RESEARCH AND TECHNOLOGICAL INNOVATION

The great distances between facilities, the performance level required of a distribution system subjected to harsh and fluctuating conditions, and the varied nature of the loads connected have fostered the development of technology-based solutions designed to ensure service continuity at a reasonable cost.

- The division selected the R&D projects most likely to improve power quality and service continuity, reduce system undergrounding costs and prolong equipment service life.
- A remote fault-signaling system for the distribution grid was developed.
- An agreement was signed with IATS, a French manufacturer of overhead line switches, to produce and market a remote-operated vacuum switch for overhead distribution lines. This technology is the product of a collaborative effort by IATS, Hydro-Québec's research institute, and Hydro-Québec Distribution.

Hydro-Québec Distribution plans to carry out 30 to 50 line undergrounding projects every year in heritage sites throughout the province. A committee set up by the Québec government determines the acceptability of projects submitted by the municipalities.

Vegetation control: the job that contributes the most to maintaining service continuity.

Lines are less and less visible in residential neighborhoods.

INFORMATION TECHNOLOGY DEVELOPMENT

The complexity of distribution system control and the wide range of operations necessary to meet the many expectations of the division's customers have led it to acquire flexible, highly efficient information technology tools.

- New system simulators were introduced in each distribution control centre to improve service quality and continuity.
- A Distribution Management System was deployed to handle service restoration priorities.

PRESERVING THE ENVIRONMENT

The division obtained an ISO 14001 registration certificate for its activities related to system maintenance in October 2000. This certification confirms the efforts expended to make the environment an integral part of the division's business processes and activities.

- Confirmation was received of the division's continued ISO 14001 certification, one year after implementation of the Environmental Management System.
- The division conducted 14,000 internal environmental assessments in order to systematically integrate environmental aspects into distribution system planning, construction and maintenance.
- As a representative of the Québec government, the division participated in the government program for undergrounding distribution systems in heritage, cultural and tourist sites, in cooperation with municipalities and telecommunications companies. Hydro-Québec Distribution is responsible for implementing this program, which will cost \$300 million over four years; Hydro-Québec will contribute \$200 million of that amount.
- Talks continued with the Québec union of municipalities on extending the underground grid into new residential neighborhoods.

EXPERTISE AND HUMAN RESOURCES

Hydro-Québec Distribution employees are in direct contact with the company's customers. They have all the information they need to respond quickly to the many different requests they receive.

- A succession plan was developed for all specialized and management positions, and skill profiles were updated.
- The work-related accident frequency rate fell from 5.42 per 200,000 hours worked in 2000 to 4.96 in 2001.
- A new process was introduced to heighten awareness of work accidents and analyze code violations; corrective measures were applied.

A meter reader, in daily contact with customers.

Communication with large-power customers is a priority.

“We firmly intend to remain a leader in power transmission. Because we meet the highest standards in the North American electricity industry, we can offer our customers here in Québec and beyond our borders service quality and continuity that are among the best in the world.”

— Jacques Régis, President
Hydro-Québec TransÉnergie

THERE ARE MANY CALLS ON THE TRANSMISSION SYSTEM, WHICH IS THE MOST EXTENSIVE IN NORTH AMERICA. NOT ONLY DOES QUÉBEC DEMAND CONTINUE TO INCREASE, BUT POWER FLOWS TO AND FROM NEIGHBORING SYSTEMS, INDEPENDENT POWER PRODUCERS AND DISTRIBUTORS HAVE GROWN STEADILY SINCE THE POWER MARKET OPENED UP.

the Transmission Provider

power in motion

Strength and Security

Hydro-Québec TransÉnergie delivers electricity to its Québec customers. It also devotes substantial efforts to developing, maintaining and improving its transmission system. Its reliability and security standards comply with the criteria laid down by the Northeast Power Coordinating Council (NPCC), one of the 10 regional boards in the North American Electric Reliability Council (NERC). ■ Following the deregulation of the North American power market, Hydro-Québec TransÉnergie opened up its system to other power producers and distributors, and now offers them transmission services at fair and nondiscriminatory rates. ■ At year-end, 20 customers were accredited to transmit power over the Hydro-Québec TransÉnergie system. Hydro-Québec Distribution is the division's largest customer. ■ In recent years, Hydro-Québec TransÉnergie has pursued a strategy of penetrating the most promising outside markets. A world leader in transmission system design, operation and maintenance, it plans to make the most of its technical know-how, its technological edge and the leadership of its personnel, especially in the United States and South America. ■ Hydro-Québec TransÉnergie has one subsidiary, the management holding company TransÉnergie HQ, which in turn has four others: TransÉnergie U.S., whose mission is to acquire, develop and manage profitable strategic assets in power transmission; TransÉnergie Technologies, which markets the division's value-added technological products and solutions in Québec and worldwide; TransÉnergie Services, which provides expertise in transmission system planning and operation, both in Québec and worldwide; and TransÉnergie Australia, which offers transmission expertise in technical, commercial and regulatory aspects. ■ At year-end, the Hydro-Québec TransÉnergie system comprised 32,273 km of lines, 504 substations and 15 interconnections with neighboring systems.

Jacques Régis

President
Hydro-Québec TransÉnergie

SERVICE CONTINUITY

As a result of the increase in domestic demand, coupled with the opening up of the power market, Hydro-Québec TransÉnergie must manage a growing volume of interchanges with neighboring systems, independent power producers and distributors. This calls for ongoing optimization of transmission system availability. To meet these needs on a continuous basis, Hydro-Québec TransÉnergie constantly works to strengthen its installations. Other projects are designed to enhance the capacity of its interconnections and improve access to resources outside Québec.

- The service interruption index was kept below the 0.65-hour threshold, averaging 0.51 hours per customer in 2001. This performance level was made possible by a number of steps taken to increase the strength of the Hydro-Québec TransÉnergie system.
- A transmission line running from Sainte-Marguerite-3 generating station, currently under construction, to Arnaud substation was completed.
- Work making the output from Beauharnois generating station available to the Montréal area was completed, thus increasing security of supply for the island.
- To ensure long-term operability, work amounting to \$178 million was done on the system: mainly, replacing or refurbishing circuit breakers, replacing insulators in substations and on lines, and rebuilding the switchyards at Beauharnois.

SYSTEM DEVELOPMENT

To meet the growing demand, Hydro-Québec TransÉnergie is modernizing its facilities and optimizing their use through the careful management of power flows to and from neighboring systems, independent power producers and distributors. Its goal is to deliver high-quality electricity, in sufficient quantities and at the best possible cost, to all its customers.

- Two single-circuit lines were replaced by one double-circuit line running 10.8 km between Sherbrooke and Saint-François substations, in order to improve the performance of the 120-kV system that serves the Sherbrooke area.
- A second circuit and a third synchronous interconnection about 20 km long were commissioned between the Hydro-Québec TransÉnergie and Alcan systems, to increase security of supply to residents and industries in the Lac-Saint-Jean region.
- The division received its first long-term (one year) reservation of capacity use by a company other than Hydro-Québec, to carry 100 MW of firm power to the New York system.

PRESERVING THE ENVIRONMENT

Hydro-Québec TransÉnergie is constantly seeking ways to improve its environmental performance by incorporating this issue into every stage of facility construction, operation and maintenance. It implements various measures ensuring the best possible energy efficiency as well as the long-term preservation of balance within the biophysical and social environments that host its installations.

- Work on the implementation of an ISO 14001-compliant environmental management system continued, and the managers and employees concerned began conducting internal audits to familiarize themselves with this system.
- The first step of a two-part program to reduce ozone-depleting substances was launched.

Work at Beauharnois substation: increasing the security of supply to the island of Montréal.

INTERNATIONAL PRESENCE

Hydro-Québec TransÉnergie is always on the lookout for new outlets where its know-how can be put to good use. The resulting increase in revenue from foreign projects contributes to Hydro-Québec's long-term profitability.

Hydro-Québec TransÉnergie's foreign operations include marketing its expertise and value-added technology-based solutions, as well as developing projects and acquiring profitable assets.

- Construction began on the MurrayLink project in Australia, in partnership with SNC-Lavalin. The project involves building a 180-km interconnection between the states of Victoria and South Australia, along with two converter stations.
- A draft design study was completed by TransÉnergie U.S., in partnership with Hydro One, for the construction of an underwater interconnection linking Ontario and Pennsylvania via Lake Erie.

RESEARCH AND TECHNOLOGICAL INNOVATION

Hydro-Québec TransÉnergie relies on innovation to uphold its position as a leader in the transmission field. R&D remains a key strategy for ensuring medium- and long-term growth. These efforts focus mainly on improving system reliability and preserving long-term operability, enhancing the division's competitive position, developing interconnection capacity and maintaining power quality.

- Tests were developed to measure the effectiveness of thermal and mechanical methods for de-icing transmission lines and substation equipment.
- A pilot project at Châteauguay substation, aimed at limiting interconnection downtime by conducting equipment maintenance at times of low use, was evaluated.
- At a substation just outside Montréal, a new type of equipment, the variable-frequency transformer, was evaluated. Developed by General Electric of Canada, this technology is being applied for the first time anywhere in the world.
- A new research program was launched to improve equipment performance in 735-kV substations in cases of heavy ice accretion. The program is a joint effort by the Université du Québec à Chicoutimi industrial chair on atmospheric icing of power system equipment and Hydro-Québec's research institute.
- Research projects were assigned to the university and industrial chair on transmission lines at the Université de Sherbrooke's engineering faculty, covering damage detection using dynamic testing, line resistance to wind loads and ways to prevent towers from cascading.
- The 1965 introduction of the 735-kV transmission technology developed by Hydro-Québec received the award for the most outstanding technological innovation of the 20th century, presented by the Ordre des technologues professionnels du Québec.

Hydro-Québec received the award for the most outstanding technological innovation of the 20th century: 735-kV transmission.

I.T. AND TRANSMISSION

The efficiency of Hydro-Québec TransÉnergie is partly based on information technologies that help optimize system operation and maintenance activities.

- A new computer infrastructure, using Siemens-IBM technology, was introduced as part of the modernization of the System Control Centre.
- The division began implementing new system maintenance management software (MaximOM project).
- The last two stages in the startup of the Generation Rejection and Remote Load-shedding (GRRL) system, which works to prevent major power failures and maintain transmission system integrity in case of an exceptional event, were completed.

EXPERTISE AND HUMAN RESOURCES

To achieve Hydro-Québec TransÉnergie's objectives of growth and long-term operability, the commitment and competence of our employees are absolutely essential. In 2001 the division pursued various activities to increase employee motivation. It must also ensure a smooth succession, in particular among technical personnel, and offer training that keeps abreast of technological developments.

- The division continued the implementation of the skill management plan, which includes strategies for acquiring, maintaining and developing the necessary skills to ensure day-to-day management.
- Professional-development programs to prepare the next generation of employees were maintained.
- The division assumed an additional function, namely management of the unit in charge of the company's telecommunications, to provide greater synergy in transmission activities.
- A remote self-training module, intended for all Hydro-Québec TransÉnergie personnel, was introduced on the intranet site.
- The work safety code, which sets out safety principles to be followed by Hydro-Québec personnel and contractors, was updated.
- The frequency of work-related accidents fell from 4.7 per 200,000 hours worked in 2000 to 4.4 in 2001.
- The employee motivation index rose from 6.4 out of 10 in 2000 to 6.6 in 2001.

REGULATORY

Many Hydro-Québec TransÉnergie activities are governed by agencies responsible for ensuring reliability and nondiscriminatory marketing of transmission capacity. To operate on the new North American power market, Hydro-Québec TransÉnergie must comply with the requirements of the Régie de l'énergie, in Québec, and of the NERC, in the United States.

- The division filed its first rate case with the Régie requesting approval of new transmission rates that would allow a reasonable return on the rate base. It also requested certain amendments to Hydro-Québec's *Open-Access Transmission Tariff*.
- Hydro-Québec TransÉnergie, having sole responsibility for the reliability and security of Québec's transmission system, adopted an operating model based on the RTOs (Regional Transmission Organizations) in the U.S.

GRRL: a new automatic protection system is now operational.

IN 2001, HYDRO-QUÉBEC
TRANSÉNERGIE POSTED SALES
OF APPROXIMATELY \$3 BILLION.

“Spurred by market growth in Québec and northeastern North America, Hydro-Québec Production will continue developing its generating capability, with particular emphasis on Québec’s own hydropower potential.”

— **Thierry Vandal**, President
Hydro-Québec Production

BEUHARNOIS GENERATING STATION IS ONE OF THE OLDEST AND MOST POWERFUL IN QUÉBEC. ITS 38 UNITS OCCUPY BOTH SIDES OF A CANAL FOR NEARLY A KILOMETRE. MAJOR REHABILITATION WORK HAS GONE ON SINCE 1994 TO ADD SEVERAL DECADES TO THE SERVICE LIFE OF THIS STRATEGIC PLANT.

the Generator

the power to compete

Profitability and Growth

Hydro-Québec Production generates electricity and sells it on wholesale markets both inside and outside Québec. ■ For the Québec market, the division supplies a heritage pool of up to 165 TWh per year, which it is obliged to sell at a fixed price of 2.79 cents per kilowatthour. Beyond this volume, it may compete freely in response to Hydro-Québec Distribution's calls for tenders. ■ It conducts various transactions on markets outside Québec. These transactions, mainly short-term electricity sales and purchases, generate significant revenue, offer attractive profits and help optimize the use of our generating stations and reservoirs. ■ The division operates generating facilities which are 93% hydroelectric in terms of installed capacity. It runs them under optimum cost and efficiency conditions, and takes the necessary measures to ensure their long-term operability. ■ The division maintains a diversified portfolio of projects to increase its generating capacity and take advantage of market growth. As well, it secures other sources of supply by such means as long-term contracts with independent power producers in Québec, with the focus on renewable energy, including wind power. ■ Hydro-Québec Production also makes the most of its expertise on foreign markets, such as South America, China and the United States, through targeted investments and technical services contracts.

Thierry Vandal
President
Hydro-Québec Production

Hydro-Québec negotiates agreements with the Crees concerning two new James Bay projects: Eastmain-1, and Eastmain-1-A with partial diversion of the Rupert River.

OPERATIONS AND PROJECTS

To seize business opportunities on the deregulated power market in Québec and the rest of North America, Hydro-Québec Production is optimizing the output of its existing generating facilities and breaking ground on new developments. Its generating fleet, which includes 51 hydroelectric generating stations on Québec's main drainage basins and 5 thermal generating stations, has a total installed capacity of 31,051 MW. Added to this is most of the generation from Churchill Falls power plant, in Labrador, which has a capacity of 5,428 MW. The hydroelectric developments also include 25 large reservoirs, with a storage capacity of 172 TWh, and 562 dikes and dams.

Electricity Sales to Hydro-Québec Distribution
(TWh)

Sales Outside Québec and Short-Term Purchases
(\$M)

— Sales
— Purchases

- Construction continued on a new \$450-million hydroelectric development to replace the existing facility at Grand-Mère.
- Construction began on an \$800-million, 526-MW hydroelectric generating station on the Toulnostouc River.
- Agreements were signed with the Crees for the development of two hydropower projects in the James Bay region: the first is construction of Eastmain-1, with an installed capacity of 480 MW, at an estimated cost of \$1.7 billion; the second is construction of Eastmain-1-A, with an installed capacity of about 770 MW, and partial diversion of the Rupert River, a project worth around \$2.1 billion.
- Draft design studies began for the construction of a 450-MW generating station on the Péribonka River, involving an estimated potential investment of \$1 billion.
- Draft design studies began for the construction of an 800-MW gas-fired power plant next to the Beauharnois canal, a potential investment of some \$550 million. A memorandum of understanding was signed with the municipality of Melocheville and the Beauharnois-Salaberry RCM covering the project's local and regional economic spinoffs.
- Draft design studies began for the construction of a \$500-million, 220-MW generating station on the Romaine River.
- Refurbishing work started on Pont-Arnaud and Chute-Garneau generating stations, which have a capacity of under 50 MW each, in preparation for a transfer of ownership.
- The \$80-million refurbishing of Rapides-des-Quinze generating station got under way.
- Rehabilitation of Beauharnois and Bersimis-1 generating stations continued.
- The major overhaul of Manic-2 generating station and upgrading of Shawinigan-2 and Shawinigan-3 generating stations were completed.
- Projects for the partial diversion of the Portneuf and Sault aux Cochons rivers to the Betsiamites generating facilities were authorized by the Québec government.
- The Canadian Electricity Association recognized the outstanding performance of Rapides-Farmers generating station. The plant's no. 4 unit recorded the highest load factor in Canada: 99.93%.
- Some strategic IT projects were completed, including the deployment of MaximOM, a project to improve maintenance planning, and startup of the GESTEAU 2 system for monitoring runoff and optimizing reservoir management.

Manic-2 gets a new look.

WHOLESALE MARKETS

While supplying the heritage pool on the Québec market, Hydro-Québec Production is active on markets in northeastern North America. Its power sales and trading activities focus on the sale of surplus electricity produced in Québec, the purchase of electricity for banking and resale, and electricity purchase and sale transactions on the U.S. market.

- Sales to Hydro-Québec Distribution: 151.9 TWh at a fixed price of 2.79 cents per kilowatthour (heritage pool).
- Sales outside Québec: 42.4 TWh; these sales generated revenue of \$3.1 billion, up 31% from 2000. Short-term electricity purchases totaled \$2.2 billion.
- The 1998 agreement with Newfoundland and Labrador Hydro for Hydro-Québec's purchase of surplus electricity (130 MW) generated at Churchill Falls power plant was renewed for a term of three years.
- The major long-term sales contract with New England electric utilities expired.
- The dispute between Hydro-Québec and Vermont Joint Owners was settled by an international arbitration tribunal. The contract between the two parties is maintained until its expiry date in 2020, and Hydro-Québec will pay US\$9 million for the nondelivery of power during the ice storm of 1998.

RESEARCH AND INNOVATION

Hydro-Québec Production relies on technological innovation to continuously improve the performance of its generating facilities and ensure their long-term operability for future generations. The division concentrates its R&D activities in areas of strategic importance.

- Some 15 R&D projects worth more than \$26 million altogether were continued, focusing on the long-term operability and improved performance of generating assets, their profitability in a restructured power market, and the development of new construction methods.

PRESERVING THE ENVIRONMENT

Hydropower, a renewable energy, plays a leading role in the division's growth plans and remains its preferred generation option. The division also sees to it that its facilities are maintained and operated with a view to environmental protection.

- ISO 14001 certification was obtained for plant operations.
- Environmental studies on mercury, greenhouse gases, and terrestrial and aquatic resources and habitats, as well as environmental follow-up at the La Grande complex, continued.

The energy trading floor is a hive of activity 24 hours a day.

Water samples for environmental studies underway in the James Bay region.

INTERNATIONAL PRESENCE

Market restructuring and energy needs in the developing countries offer attractive business opportunities and allow Hydro-Québec Production to utilize its employees' know-how. The division remained on the lookout for profitable international opportunities, including projects for the acquisition or management of strategic hydroelectric assets. It also continued developing technical assistance services in such market niches as specialized maintenance and refurbishing of hydroelectric generating stations, particularly in the United States.

- In Panama, the division continued operating the country's largest hydroelectric facility, Fortuna, in which Hydro-Québec has a 16.3% stake. The 2001 financial results exceeded expectations.
- In China, it continued the operation and development of Meiya Power Company, in which Hydro-Québec holds a 20% interest. Seven generating stations are in operation, and two new power plant projects were launched in 2001. Qingshan generating station, in which Hydro-Québec also has a stake, was commissioned.
- In 2001, professional services contracts were carried out mainly in China, Panama, Venezuela, Cameroon and Vietnam, for revenue of more than \$6 million.
- A new company, Hydro Power Solutions, was set up to offer American companies services in the area of hydroelectric plant management, operation, maintenance and rehabilitation.

EXPERTISE AND HUMAN RESOURCES

To assure its customers of reliable, high-quality services, Hydro-Québec Production can count on well-qualified personnel: its 3,339 employees constantly keep their skills up to date. The division is also involved in a number of activities designed to motivate its people and increase the flexibility of the workforce.

- An extensive technical training program on job safety was drafted; new technologies will be used to deliver the training.
- The division continued the implementation of a succession plan to preserve its expertise.

At all times, Hydro-Québec Production maintains enough energy reserve to offset a potential runoff deficit of 64 TWh over two consecutive years, and a capacity reserve representing 10% to 12% of demand under its contracts.

Employee skills ensure quality and reliability.

“Our expertise is focused on delivering shared services and projects that help improve the performance and profitability of Hydro-Québec’s other divisions.”

— **Élie Saheb**, President

Hydro-Québec Ingénierie, approvisionnement et construction

IN 2004, THE NEW GRAND-MÈRE GENERATING STATION, ON THE SAINT-MAURICE RIVER, WILL REPLACE THE OLD ONE, WHICH IS OVER 85 YEARS OLD. THIS IS NOW THE LARGEST GOING JOBSITE IN QUÉBEC—AT THE PEAK OF CONSTRUCTION, MORE THAN 500 PEOPLE WORK THERE. WHAT’S MORE, 75% OF THE WORKERS ARE LOCAL.

the Builder

the power to construct

Shared Services with High Value Added

This division supplies expertise and shared services in engineering, procurement, construction project management and information technologies. ■■■ It carries out generation and transmission projects, both for Hydro-Québec's other divisions and on the international scene. As part of its mission here in Québec, it participates in the development of the province's hydropower potential and transmission system, and works to ensure the long-term operability of the company's facilities. ■■■ The division is also responsible for supplying the goods and services that support the company's mission and operations. It manages Hydro-Québec's real estate portfolio and its vehicle and air fleets. ■■■ In addition, the division provides IT services and strategies, and performs engineering and construction work for Hydro-Québec's telecommunications projects. ■■■ Through the subsidiary Société d'énergie de la Baie James (SEBJ), it carries out development projects in Québec as well as abroad on behalf of Hydro-Québec International. ■■■ By offering diversified expertise, high-value-added services and economies of scale made possible by its volume of activity, Hydro-Québec Ingénierie, approvisionnement et construction is a strategic partner for the other Hydro-Québec divisions.

Élie Saheb

President

Hydro-Québec Ingénierie,

approvisionnement et construction

ENGINEERING AND CONSTRUCTION

In 2001, the engineering and construction units carried out work worth a total of \$725 million. There was a slight slowdown compared to 2000, due to the timeframes involved in obtaining government authorization for several generation and transmission projects.

- Draft design studies were done for the partial diversion of the Manouane, Portneuf and Sault aux Cochons rivers and for new generating stations: Mercier, Romaine-1, Péribonka and Tabaret.
- Draft design studies were done for flood control in the Lake Kénogami drainage basin, on behalf of the Québec government.
- Refurbishing began or continued on Outardes-3, Bersimis-1, Beauharnois, Shawinigan-2 and Rapides-des-Quinze generating stations, and construction work was done on spillways at Pont-Arnaud and Chute-Garneau.
- Construction of Toulnostouc hydroelectric generating station (526 MW) started up.
- Installation of a 100-MW variable-frequency transformer—an innovative technology for connecting asynchronous systems—started up at Langlois substation.
- Work continued on the Sainte-Marguerite-3 hydroelectric development (882 MW).
- Work continued on the Grand-Mère hydroelectric development (220 MW).
- The new System Control Centre opened.
- Improvements were made in design and construction methods, offering customers annual savings of 2% on project costs.

After operating for more than 75 years, Rapides-des-Quinze generating station needed a major overhaul.

The new Grand-Mère plant under construction.

PROCUREMENT AND SERVICES

The procurement and services unit aims for the best price/quality ratio, in order to support its customers' operations and meet their needs, and adheres to high standards for product quality and supplier qualification. It has adopted various strategies for maintaining and even improving security of supply in strategic goods and services. This initiative enables it to take advantage of the best conditions available on the market and sustain the development of Québec's industrial infrastructure.

Considerable savings were achieved through new business practices, effective strategies, and supply and partnership agreements. In addition, a number of agreements were reached with local suppliers, maximizing the economic spinoffs throughout Québec.

- Commitments laid out in the policy "Our Acquisition of Goods and Services" were met.
- Goods and services worth a total of \$1.6 billion were acquired: \$682 million in goods, \$23 million in rentals, \$581 million in construction work and \$276 million in professional services.
- Savings of \$62 million have been achieved since January 2000 through the consolidation of needs, supplier agreements, and new business strategies and practices, as well as the review of product lines and technical specifications in cooperation with the business units.
- In the course of the renewal of the company's air fleet, the division acquired two 74-seater Dash 8 Q-400 aircraft to transport employees to northern regions.
- About 4% of the motor vehicle fleet was optimized; a 2001–2005 acquisition plan was implemented to ensure its long-term operability.
- Under the 2000–2004 master plan for real estate management, the use of the company's administrative offices in downtown Montréal was optimized.
- The division is responsible for a major contribution to sustaining the Québec economy: 93% of goods and services were purchased from Québec-based companies.

The performance, reliability and profitability of the company's generation and transmission facilities hinge on top-quality design and careful management of procurement and construction contracts.

It takes a lot of material and equipment to keep the company running.

Inside a warehouse: Hydro-Québec's purchases of goods and services are a powerful economic lever for Québec.

INFORMATION TECHNOLOGIES

The units responsible for information technologies provide strategies and services ranging from IT infrastructure to operation of office automation systems and tools. They support the divisions' key activities and guarantee the security of electronic communications with customers and partners. In addition, they are in charge of IT integration throughout the company, ensuring that employees can readily access these essential work tools. IT functions became the division's responsibility in 2001.

- IT development was rationalized, in cooperation with the divisions, to curb the growth of investments.
- New services designed to facilitate e-commerce and communications with customers and suppliers have been included on Hydro-Québec's Web site.
- A tool was made available to customers that allows them to access their account information and communicate with Hydro-Québec over secure Internet connections.
- Measures were implemented to ensure the security of strategic information systems and data confidentiality.
- Version 4.6 of SAP R/3 was introduced in the following sectors: equipment management, building and vehicle maintenance management, and management of human resources, training, finance and accounting.
- A software program was introduced to manage maintenance of generating stations and transmission substations.
- The division began implementing the company's new technological architecture, including a stable, secure, standardized IT environment for workstations.

c) Specialized services, professional services and other work.

PRESERVING THE ENVIRONMENT

Sustainable development and environmental protection have always been priority values in Hydro-Québec's procurement and construction activities. The division pays particular attention to these issues, especially when developing draft designs for refurbishments or new construction.

- Environmental Management Systems were integrated into procurement and project management functions, in order to achieve a balance between profitability and environmental acceptability.
- In the procurement and services department, the territorial branches for northwestern and eastern Québec received ISO 14001 certification, and the branches for the Island of Montréal and south-central Québec maintained theirs.
- The projects and construction department, SEBJ and the environment unit of the expertise department also received ISO 14001 certification.
- An inventory was taken of ozone-depleting substances used by the company, and alternative solutions were developed.
- The recovery of residual hazardous materials from sites at the La Grande complex was completed.
- The division recovered 8,965 tonnes of residual hazardous materials from all over the province.

INTERNATIONAL PRESENCE

The division can count on the expertise and flexibility of its personnel to expand its foreign operations. It targets the following areas, in particular: rehabilitation and optimization of hydroelectric generating stations, installation of optical fibres on live power lines, development of power-grid control systems, and engineering and construction of interconnection lines. The division also works with other Hydro-Québec divisions and consulting engineers on foreign projects.

- The division carried out a technical assistance contract for the modernization of the national transmission control centre of the Algerian corporation Sonelgaz.
- It continued upgrading the transmission system control centre of the Bangladesh Power Development Board.
- Consulting services totaling \$1.2 million were provided on projects in China, Cambodia, Algeria and Morocco.

An award of excellence for the new building at Beauharnois generating station.

EXPERTISE AND HUMAN RESOURCES

To achieve its objectives, the division must maintain and develop its employees' expertise.

- A succession program was set up to ensure the transfer of knowledge within the division.
- At SEBJ, a collective agreement was renewed with the United Steel Workers of America, promoting greater workforce flexibility.
- The overall satisfaction level of the division's employees rose to 8.07 out of 10 from 7.80 in 2000.
- The employee motivation index rose to 6.66 compared with 6.34 in 2000.

The Ordre des architectes du Québec singled out Hydro-Québec in its awards of excellence, Industrial Architecture category, for the design of the west extension on Beauharnois generating station, which underwent a major refurbishing.

Employee know-how:
a legacy we must pass on.

Technological innovation, R&D, environmental protection and human resources management are strategic sectors that bind the four divisions together and contribute to Hydro-Québec's presence and impact.

HYDRO-QUÉBEC'S HEAD OFFICE STANDS AT THE HUB OF MONTRÉAL'S ECONOMY.

Technological Innovation

Hydro-Québec makes extensive use of technology in its operations. Electricity plays a vital role in people's lives and the economy, and will only grow in importance in the future. To maintain its leadership, improve its performance and ensure its long-term growth in an increasingly competitive world, the company must continue to innovate.

The integrated innovation management program introduced in 2000 has yielded the hoped-for results. This new process allows researchers, users, business specialists and external partners to interact in order to better meet the company's business priorities.

The researchers and scientists at Hydro-Québec's research institute, who possess unique expertise developed over the last 30 years, are the cornerstone of the company's R&D activities. The institute has two main facilities, located in Varennes and Shawinigan.

The success of a company's innovation strategy also hinges on a sound knowledge of the business environment, the players involved and technological developments. To monitor these trends, Hydro-Québec has stepped up its business and technology intelligence-gathering.

Lastly, Hydro-Québec embarked upon a technological roadmapping exercise in 2001, looking ahead 20 years, in consultation with the company's experts and other scientists in the energy field.

R&D

Hydro-Québec's research institute conducts R&D and tests in order to promote the commercialization and implementation of new technologies enabling the company to supply its customers with reliable power, at the lowest possible cost and with a concern for environmental protection. It operates in Varennes, Shawinigan and Montréal.

In 2001, the research teams worked on 65 projects linked to the company's core operations. In generation, their efforts focused on equipment performance, safety and profitability. Their transmission projects dealt with the protection, growth and long-term operability of the high-voltage system, a field in which Hydro-Québec is a world leader. In distribution, their research helped improve the reliability of overhead and underground grids and make maintenance work safer for crews. The teams also worked to improve products and processes connected with electricity applications.

- R&D investments in 2001 totaled \$103 million. In 2000, Hydro-Québec was one of the 15 Canadian firms that spent \$100 million or more on R&D.
- Tests began on experimental setups to check the mechanical behavior of new distribution lines under different climatic conditions.
- An innovation project designed to add 50% to the useful life of wood poles was completed.
- An agreement was signed with an industrial partner to commercialize a new wood pole treatment process that will make it easier for linemen to do their work.
- Remarkable results were obtained in hydraulic turbines: extended service life, new methods developed for *in situ* repairs using robots, and increased efficiency. With regard to efficiency, hydraulic turbine analysis models (known by their French acronym, MATH) have yielded savings of \$3.5 million since 1998 and should generate recurring savings of \$4.7 million after 2005.
- New de-icing techniques and strategies were developed for substations and transmission lines.
- Transmission research was conducted on various real-time control systems and on ways to improve system performance.
- An industrial partner set up a centre of excellence at the research institute's Shawinigan laboratory. The centre specializes in R&D on new electric drying processes for the lumber industry.
- The first prize in the Québec entrepreneurship competition, Technological Innovation category, was awarded to three researchers at the Shawinigan laboratory for their project on the electrosynthesis of chemicals.
- Simulation software is being installed and developed for electromagnetic transient phenomena (EMTP); this program examines transmission equipment characteristics and optimizes their design. A study of transient recovery voltages for circuit breakers, after series compensation on 735-kV lines, has generated savings of \$60 million in the last decade or so. The EMTP software is being developed in partnership with EDF (France), Hydro One (Ontario), EPRI (United States) and CRIEPI (Japan).
- Hydro-Québec's research institute received ISO 14001 certification.
- Several of the institute's laboratories were registered under the new ISO/IEC 17025 standard.

Repair of a turbine runner, a job made easier by the robot Scompi.

CORPORATE VENTURE CAPITAL

Hydro-Québec endeavors to obtain a high rate of return on its venture capital investments, which it uses to exercise proactive technology monitoring and gain a better strategic understanding of the market. Through its venture capital subsidiary, Hydro-Québec CapiTech, it invests directly in companies at different stages of development and in other venture capital funds in the energy sector. In partnership with the private sector, the company also exploits the intellectual property resulting from its R&D activities through the subsidiary Hydro-Québec IndusTech, whose portfolio is managed by Hydro-Québec CapiTech.

- Managed venture capital portfolios of \$395.9 million in investments or commitments.
- Seven direct investments and ten direct reinvestments totaling \$30.9 million were made in 2001, bringing direct venture capital investments to \$106 million.
- The company committed to a \$21-million investment in a European fund, SAM Private Equity Energy Fund, making Hydro-Québec CapiTech the lead investor of this fund and bringing its venture capital fund commitments and investments to \$47 million.
- An initial dividend of \$7.5 million was paid to Hydro-Québec.
- Various activities were carried out for Hydro-Québec divisions in order to better meet their needs; these included publishing a strategic intelligence-gathering newsletter on new energy-related technologies; holding a forum on corporate venture capital in the energy sector, attended by 150 people, 50 of them representing Hydro-Québec; and carrying out studies on automated management of distribution systems, electric energy storage and modular nuclear reactors.
- An agreement was reached with Innovatech Québec to offer financial support for companies in Energy Valley, in the Mauricie region, a major hub of technological innovation.
- An agreement was reached between Hydro-Québec and two major European partners, Shell Hydrogen and Gesellschaft für Elektrometallurgie (GfE), to establish HERA Hydrogen Storage Systems, which is developing a hydrogen storage technology based on metal hydrides.
- A partnership was set up between Kerr-McGee Chemical and Hydro-Québec, in which each has a 50% stake, to finance the AVESTOR group. AVESTOR has been commissioned to develop and market the LMP (lithium-metal-polymer) battery, which emerged from the ACEP technology developed by Hydro-Québec's research institute and France's Centre National de la Recherche Scientifique.
- Two partnering arrangements were negotiated, refocusing the activities of Technologies M4 on producing two types of generators—an application of the motor-wheel technology developed in Hydro-Québec laboratories.

Metallic Power, a subsidiary of Hydro-Québec CapiTech, is developing and marketing a line of fuel cells using zinc-air technology.

PLANNING FOR THE FUTURE AND LONG-TERM VIABILITY

In 2001, Hydro-Québec embarked upon a major technology forecasting exercise, looking ahead 20 years, in consultation with the in-house experts and other scientists in the energy field. The object of this exercise is to determine the future technologies that may have a substantial long-term impact on operations. It is performed using a planning tool called a technological roadmap, which anticipates technological changes that could affect the company's business structure and points to the areas in which proactive monitoring is needed.

- Five innovation projects were developed, allowing Hydro-Québec to continue playing a leadership role on the North American power market in the following areas:
 - Active system management in real time, so as to maximize returns on energy transactions: \$500,000 in 2001.
 - Enhanced overall system efficiency, from generating stations to customers' premises: \$500,000 in 2001.
 - Managing the emergence of distributed generation: \$2 million in 2001.
 - Reducing transmission system constraints, through energy storage and transmission technologies: \$500,000 in 2001.
 - Understanding the effects of climate change on runoff, electricity demand and operating facilities: \$1.5 million in 2001, part of it within the OURANOS consortium.
- The company participated in the OURANOS consortium, which also includes eight Québec government departments, Environment Canada and all the Québec universities. The consortium's research activities are concentrated on climate modeling, sensitivity to climate change and quantification of impacts and adaptation scenarios. It will have a total budget of \$28 million by 2004.

Technological innovation is an important growth tool and a major economic lever for Hydro-Québec.

Technological Initiative Horizon

Natural Gas Sector

Hydro-Québec's operations in the natural gas sector cover the pipelining of oil, natural gas and natural gas liquids, as well as the distribution of natural gas by the holding company Noverco Inc., in which the company has a stake. They also include monitoring the emergence and penetration of new distributed-generation technologies based on natural gas.

Hydro-Québec holds 41.2% of Noverco's share capital and two options on 9.2% of Noverco's shares.

Noverco's main subsidiary is Gaz Métropolitain and Company, Limited Partnership (GMCLP), in which it has a 77.4% stake through Gaz Métropolitain, inc., the general partner. GMCLP is involved in the distribution and pipelining of natural gas.

Noverco also holds a portion of the common shares of Enbridge Inc., the world's largest oil carrier and the largest natural gas distributor in Canada.

Hydro-Québec sits on the GMCLP and Enbridge boards of directors.

Its commitment to the natural gas sector is in line with the trend toward convergence of gas and electricity transmission and distribution companies throughout North America.

- Net income of \$27 million in 2001 from the stake in Noverco was \$7 million higher than in 2000. This increase is due to the improvement in Enbridge's operating results.
- Hydro-Québec and GMCLP participated in a demonstration project for a 60-kW microturbine operated in cogeneration mode (electricity and heat) at a customer's facility, to explore all facets of this developing technology.

Expanding Hydro-Québec's activities into the natural gas sector enables the company to meet Québec's energy needs better and offers it investment opportunities in a fast-growing field.

Michel Gourdeau
Executive Vice President
Natural Gas Sector

Human Resources

Like many other North American companies, Hydro-Québec must deal with the aging of much of its personnel. At the same time, technology is developing at such a rapid pace that the company must intensify its efforts to ensure succession in strategic positions.

The human resources department is responsible for helping Hydro-Québec meet these challenges and providing a qualified and motivated workforce so that the company can fulfill its mission. It therefore establishes employee recruitment, training and motivation programs, and defines HR management approaches and strategies in cooperation with the company's divisions. The department is also in charge of occupational health, as well as negotiating labor agreements with employee representatives.

SUCCESSION

Because succession is an important issue that entails some risk, Hydro-Québec has developed an overall succession support plan. This plan must guarantee the continuity of know-how by providing efficient, targeted ways of passing on skills and maintaining employee loyalty.

- The department stepped up its efforts to fill 40% of personnel needs with new graduates for engineering and other specialized positions.
- Partnerships were established with schools and universities in order to meet the company's workforce needs; one such partnership led to the creation of the Institute for Electrical Engineering.
- Skills management techniques were applied, for example, distance learning tools for workplace training from a virtual campus.
- The department recruited supervisory personnel by seeking out people with management skills, setting up an evaluation centre and offering career plans for executives.

INDUSTRIAL RELATIONS

- A first collective agreement was signed with the Hydro-Québec specialists' union.
- The final touches were put on the empowerment program set up for Hydro-Québec trade employees—a program designed to improve the efficiency of work processes, encourage employee participation in these processes and ensure better cooperation between employees and managers.
- The provisions of the *Pay Equity Act* were applied company-wide, and 10 specific pay equity programs were developed in conjunction with unionized and non-unionized employee representatives.

We are planning for succession.

HEALTH AND SAFETY

- A team was formed to draw up an attendance management action plan. A number of measures were taken, including improved data collection, more detailed analysis of available management information, fuller statistics on absenteeism in the company, and identification of factors that help boost job attendance. In addition, new training sessions were given throughout the company, disability management was centralized, and health and safety tips were offered on the company's intranet site.
- Accident frequency fell to 4.07 per 200,000 hours worked from 4.39 the previous year, which is in line with industry levels.
- An integrated OHS management program was deployed, supplemented by the improvement plans and other measures adopted by the divisions.
- There has been a significant decrease in the severity of work-related accidents since 1992.

MOTIVATION

- The overall employee motivation index rose 0.31 points to its highest level ever: 6.64 out of 10. This increase is due to organizational stability, the empowerment program for trade employees and the company's solid performance.
- The learning map exercise, designed to foster a shared understanding among employees of the issues and challenges facing the company, drew to a close. This exercise had a positive effect on the employee motivation index.

Work-related accidents at Hydro-Québec decreased in 2001.

Environment

Hydro-Québec is concerned with sustainable development and makes careful use of the resources it employs to fulfill its mission. With hydropower accounting for 96% of its installed capacity, it generates clean, renewable energy, thus helping to protect the environment for future generations, both in Québec and beyond its borders.

In 1997, the company began introducing ISO 14001-compliant environmental management systems, a project due to be completed by 2003. This marked its commitment to incorporating environmental concerns into all its decision-making processes and all stages in the life cycle of its products, services and facilities. Through its sales outside Québec, the company helps neighboring power producers avoid atmospheric emissions, thus contributing to the fight against greenhouse gases in northeastern North America.

Most of the company's divisions and service units have already adopted a declaration of environmental principles to better meet ISO 14001 requirements. The environment unit, specifically, is in charge of following up on strategic environmental issues, recommending corporate strategies and assuring Senior Management that Hydro-Québec and its divisions are properly equipped to manage the environmental impact of the company's activities.

- All administrative units continued their efforts to secure or maintain ISO 14001 certification.
- The Fondation Hydro-Québec pour l'environnement, a non-profit organization set up to fund projects that contribute to long-term environmental protection through partnerships with communities, was officially launched. With an annual operating budget of approximately \$1 million, the Foundation signed agreements with 14 environmental organizations in 8 regions of Québec in 2001.
- The company published the *Summary of Knowledge Acquired in Northern Environments from 1970 to 2000*, an overview of environmental studies carried out by Hydro-Québec over the last 30 years.

An audit of data for 2000 performed by Deloitte & Touche LLP in 2001 enables Hydro-Québec to place a power content label on the electricity it sells. Based on these data, each terawatt-hour sold by Hydro-Québec generates 40.1 times less CO₂ (carbon dioxide), 31.5 times less SO₂ (sulphur dioxide) and 28.7 times less NO_x (nitrous oxides) than the regional average for electric utilities in the six New England states, New York State, Ontario and New Brunswick.

Thirty years of valuable lessons from northern Québec, in and around the La Grande complex.

Projects that contribute to long-term environmental protection.

International Role

Hydro-Québec works continuously with the leading international organizations to promote the benefits of hydroelectricity. The company also provides power-related technical assistance to developing countries.

COOPERATION

- The company was involved in some 20 projects in French-speaking countries, both independently and in cooperation with the Institut de l'énergie et de l'environnement de la Francophonie, mainly in the areas of vocational training, environment and management. Hydro-Québec also participated in seven projects in other countries, including a demonstration project for the commissioning of hydroelectric generating stations in Iran.
- It continued to cooperate with research centres and maintained relations with international and government agencies and electric utilities.

e7

- A series of seminars was held in Thailand on environmental impact assessment under the auspices of the e7, an organization made up of nine of the largest electric utilities in the G7—companies that are determined to play an active role in the international debate on the environment and sustainable development. Hydro-Québec heads up this ongoing project, with contributions from three other e7 members: Enel (Italy), Kansai (Japan) and RWE (Germany).
- A report was drawn up in cooperation with American Electric Power and Électricité de France on the power industry's achievements and challenges in the realm of sustainable development. The report will be presented by the United Nations Environment Program to heads of state and government at the next World Summit on Sustainable Development, to be held in September 2002 in Johannesburg.

CIGRÉ

- As a member of the International Council on Large Electric Systems (CIGRÉ), Hydro-Québec was involved in organizing a competition for engineering students on the technical, economic, environmental and regulatory aspects of electricity generation and transmission. The winner will attend CIGRÉ's 39th session, where he or she will meet industry leaders and experts from around the world.

CONFERENCES

- In cooperation with Gaz Métropolitain, Hydro-Québec organized the 12th International Conference on Energy, attended by about a hundred people. The event was part of the Conference of Montreal, held under the theme "Free Trade in the Americas: Challenges and Perspectives".
- The company began organizing and promoting the ICOLD (International Commission on Large Dams) conference, to be held in Montréal from June 16 to 20, 2003. This event is expected to attract over 2,000 participants from all over the world. Attendees will be offered technical tours of facilities in several different regions of Canada.

An expert from Hydro-Québec takes part in a rural electrification project in Niger for the e7.

The 12th International Conference on Energy.

Community Involvement

Because Hydro-Québec is on the ground throughout Québec, its activities have considerable spinoff effects on local economies. Besides contributing to economic development, the company supports a large number of organizations working for the community through its donations and sponsorships.

The company concentrates its donation efforts on health, education and humanitarian aid. Its sponsorships are aimed more specifically at the cultural, socioeconomic and environmental spheres. The company also supports organizations and events that promote amateur sport, such as the Québec foundation for excellence in sports and the sports challenge competition for disabled athletes.

Hydro-Québec helps organizations working in different regions of Québec. Whether in Saguenay–Lac-Saint-Jean with the festival of new Québec cinema, in Mauricie with the Trois-Rivières international voice competition, or in Québec City with the Québec Winter Carnival, the goal remains the same: to encourage local initiatives that highlight the talent and creativity of Quebecers.

- The company supported a number of health-related projects of interest to all Quebecers, such as the program for preventing depression in young people, in cooperation with the Québec mental health foundation, and the CLARA project for breast cancer screening.
- It supported research activities at Québec university hospitals and other major institutions such as the Montréal Heart Institute, the Montréal university geriatric institute and the Robert-Giffard hospital research centre.
- Funding was granted to Québec universities for research and teaching.
- Scholarships were awarded to graduate and postgraduate students.
- The company sponsored 17 research chairs in various fields, including the nuclear engineering chair at the École polytechnique, the research chair in conducting polymers at the Université de Montréal, and the Université du Québec à Chicoutimi industrial chair on atmospheric icing of power system equipment.
- Support was provided for activities conducted by the Québec Literacy Foundation and the Learning Disabilities Association of Québec.
- The company made a total contribution of over \$4 million to the annual United Way/Centraide campaign. To recognize the generosity shown by Hydro-Québec employees and pensioners over the past 25 years, Centraide of Greater Montréal presented Hydro-Québec with the “Solidaires 2000” award.
- The company continued to support the Lanaudière international festival, the Petite-Vallée song festival and the Montérégie regional environment council.
- It provided renewed support for the Orford music festival in the Eastern Townships.
- Support was provided for Pointe-aux-Outardes regional park in the North Shore region.
- Support was provided for the Abitibi-Témiscamingue international film festival.
- The company sponsored the Domaine Forget International Festival in Charlevoix, the Grand prix cycliste de la Beauce, the Tremblant music festival, the Parc de la rivière des Mille-Îles, the Tadoussac song festival and the Îles-de-la-Madeleine swim club.

Centraide: we beat our campaign target.

Strong support for cultural activities like the FrancoFolies de Montréal.

Overview

Net income grew for the third consecutive year to reach \$1,108 million, up \$30 million compared with the previous year. **Revenue** continued to grow and reached \$12,578 million, up 10.1% from 2000. This growth was driven by increased electricity transactions in the United States and transmission revenue from our recent investments in international subsidiaries, including Transelec. **Dividends** amounted to \$554 million and constituted the fifth consecutive payment to our shareholder. A cumulative amount of over \$2 billion has been paid since 1997. **Funds from operations** totaled \$3.5 billion, an increase of 5.6%, and were used to finance the entire investment program and pay down a portion of the long-term debt. **Paying down a portion of the Corporation's debt** will help lower financial expenses over the long term. A cumulative amount of over \$1.5 billion has been repaid since 1999.

Management's Discussion and Analysis reports on Hydro-Québec's consolidated and segmented results and consolidated financial position. Our analysis concludes with a brief discussion of our risk management strategy and outlook.

In our analysis, the consolidated group (Hydro-Québec) means the publicly owned corporation Hydro-Québec (the Corporation) and the companies in which it holds an interest, including its subsidiaries.

Results

GROWTH IN CONSOLIDATED RESULTS

Hydro-Québec maintained focus on its objectives of profitability and the creation of wealth for its shareholder and Québec society. For the third year in a row, Hydro-Québec improved its net income, which reached \$1,108 million, up \$30 million or 2.8% over the previous year. Moreover, the Corporation achieved this increase while fulfilling its commitment to keep rates frozen and enhancing service quality for all Québec customers.

In 2001, Hydro-Québec continued to grow with sales of \$12.6 billion, up \$1.1 billion or 10.1%. Increased transactions on U.S. markets and the electricity transmission revenue from our recent investments in our international subsidiaries, including Transelec, helped fuel this growth.

Despite the growth in sales, the profit margin was down slightly from 9.4% to 8.8%. This is due in part to a reduction in the volume of Québec-generated electricity sold to U.S. markets and to the decline in heating oil and natural gas prices on short-term energy markets in the U.S. Exceptionally mild temperatures in December also had an impact. In addition, a technical modification in the capital tax calculation, applied retroactively from 1995 on, had led to a reduction of the charge related to this tax, and thus to an improvement in the profit margin in 2000.

Total expenditure climbed by \$1.1 billion to \$8.1 billion as a result of short-term electricity purchases made as part of purchase/resale transactions on U.S. markets. These purchases alone accounted for \$0.8 billion of this increase and totaled \$2.2 billion. Inclusion of the results of new international subsidiaries also contributed to the increase.

We kept a firm handle on operating expenses in 2001; they stood at \$2,134 million, the same level as the previous year. Depreciation, amortization and decommissioning expense stood at \$1,845 million, compared with \$1,896 million in 2000. This decrease was partly due to the effect of our project portfolio review in 2000. Tax expense rose by \$66 million, or 12.6%, to \$591 million. Had we not benefited from a refund in 2000 as a result of the technical modification mentioned above, the expense for 2001 would have been similar to that of the previous year.

Despite a weak Canadian dollar, our management strategy enabled us to keep our financial expenses under control. They were down by \$19 million, or 0.6%, to \$3,350 million in 2001 from \$3,369 million in 2000.

In 2001, we reduced our interest expense by nearly \$245 million. We took advantage of lower short-term interest rates on the variable portion of long-term debt, which we maintained at 25%. We also timed our financing transactions to take advantage of attractive long-term rates. Interest rates fell because of the U.S. economy's pronounced slowdown, which prompted the U.S. Federal Reserve to reduce its bank rate. The three-month London Interbank Offered Rate (LIBOR) dropped, on average, from 6.5% in 2000 to 3.8% in 2001. The rate for three-month Canadian bankers' acceptances also fell considerably, from 5.7% in 2000 to 4.0% in 2001.

The negative effect of the weak Canadian dollar on our U.S. dollar-denominated liabilities amounted to \$175 million, but was partially offset by the positive impact of sales in U.S. dollars. The domestic economy experienced the repercussions of the U.S. economic downturn, with our dollar falling sharply against the U.S. dollar. The Canadian dollar averaged US\$0.646 in 2001, compared with US\$0.673 in 2000, a significant drop of US\$0.027.

Finally, the acquisition of Transelec in October 2000 increased financial expenses by approximately \$67 million for 2001.

OPERATING SEGMENTS

The new regulatory environment in North America has prompted most integrated electricity companies to reorganize their structures into operating segments: distribution, transmission and generation. After creating the division Hydro-Québec TransÉnergie in 1997 to comply with the rules governing the North American wholesale market, Hydro-Québec created three new divisions in 2001: Hydro-Québec Distribution, Hydro-Québec Production and Hydro-Québec Ingénierie, approvisionnement et construction. Implementing this structure changed the allocation of Hydro-Québec's activities, which are now organized as follows:

Distribution: Hydro-Québec Distribution develops and operates the Corporation's distribution system and is responsible for sales and service to its Québec customers.

Transmission: Hydro-Québec TransÉnergie develops and operates the Corporation's transmission system and markets its transmission capacity. It manages and operates transmission systems internationally and also offers its expertise to carry out development projects. In addition, Hydro-Québec TransÉnergie manages and is the principal user of Hydro-Québec's telecommunications network.

Generation: Hydro-Québec Production operates and develops the Corporation's generating facilities and a number of foreign facilities. It also guarantees the supply of heritage pool electricity to the Québec market, sells electricity on external markets and engages in energy trading activities.

Engineering, Procurement and Construction: Hydro-Québec Ingénierie, approvisionnement et construction provides engineering services and carries out construction projects in Québec and in other parts of the world. It also provides services, especially with respect to procurement and information technology, to Hydro-Québec's business units.

Other: This heading includes activities related to the gas sector, research and development, corporate activities and financial services.

SEGMENTED INFORMATION

Hydro-Québec's power distribution and transmission activities in Québec are regulated by the Régie de l'énergie du Québec, created in 1996 with the adoption of a new energy policy by the Québec government. These activities, like those of the gas sector, are subject to economic regulation based on the cost of providing service. Intersegment revenue and expenses associated with electricity sales are therefore recorded on the basis of the prevailing rates. Transmission rates were decreed by the government in 1997 and will remain in force pending Régie approval of the rate changes for which Hydro-Québec filed an application, hoping for a January 1, 2001, effective date. Moreover, electricity rates for Québec customers were set in 1998 and will remain frozen until April 2004 at the Québec government's request.

In 2000, the Québec government passed the *Act to amend the Act respecting the Régie de l'énergie*, under which Hydro-Québec Production must provide Hydro-Québec Distribution with a "heritage pool" of up to 165 TWh per year at a fixed price of 2.79 cents per kilowatthour (whether the electricity is generated or purchased) to meet the native load.

All intersegment revenue and expenses not related to electricity are valued at full cost. Revenue, operating expenses and purchases of electricity and fuel are earned or incurred directly by the segments.

Depreciation, amortization and decommissioning expense relates to fixed or other assets allocated to the segments. Taxes and financial expenses are managed by the corporate units and allocated according to the nature of the expense. Taxes are thus generally allocated to the segments according to the net assets managed by the divisions. Financial expenses are allocated to the different segments based on the financing rates applied to the net assets of each segment. Lastly, expenses related to corporate activities, or corporate expenses, are generally allocated to the segments based on operating expenses.

2000–2001 Sales Variation Factors, by Category

	Demand		Temperature		Leap year		Other factors
	TWh	\$M	TWh	\$M	TWh	\$M	\$M
Residential and farm	0.7	52	(1.4)	(91)	(0.2)	(11)	14
General and institutional	0.2	4	(0.2)	(7)	(0.1)	(5)	(21)
Industrial	0.5	29	0.0	0	(0.2)	(6)	54
Other	0.2	5	(0.1)	(2)	0.0	(1)	(5)
Total	1.6	90	(1.7)	(100)	(0.5)	(23)	42

In 2001, the industrial category was hit particularly hard by the repercussions of an economic slowdown made worse by the aftermath of September 11, which undermined business confidence. As a result, this category experienced a significant decline in growth compared with 2000. Nevertheless, demand was up 0.5 TWh, generating \$29 million in additional revenue, due to the arrival of major new customers in the chemicals and metal smelting and refining industries.

— One of the warmest Decembers in 60 years

Very mild temperatures, particularly in December, were responsible for a \$100-million drop in revenue in 2001 compared with 2000. This decrease is largely attributable to the residential and farm category, whose heating requirements make it more sensitive to climatic changes than other categories.

— Other variation factors

A decrease of 0.5 TWh in sales and \$23 million in revenue for 2001 was caused by the fact that the previous year was a leap year and thus included an extra day of consumption. The industrial sector benefited from the effect of the exchange rate on sales in U.S. dollars.

Cumulative Effect of Temperature Variations Between 2001 and 2000 on Sales Revenue

(\$M)

Other Activities

A gain of nearly \$10 million resulted from the sale to COGNICASE of our interest in M3i, an integrated outage management software design firm in the power distribution field. In connection with this transaction, we signed a licence agreement with COGNICASE for our Distribution Management System software, which generated \$9 million in royalties in 2001.

Hydro-Québec Distribution is continuing its disinvestment strategy in its international activities, concentrating instead on technical assistance services that provide a lucrative return. Activities are carried out by a limited number of resources, with an emphasis on Québec business partnerships.

TRANSMISSION

The stability and reliability of our power transmission grid remains a constant concern in our efforts to meet our customers' growing needs. With this in mind, Hydro-Québec TransÉnergie pursued its system reliability improvement program. Furthermore, several measures were taken to ensure the long-term operability of the transmission system, including a number of modernization projects.

During public hearings held by the Régie de l'énergie, Hydro-Québec TransÉnergie presented arguments to show that its applications to increase transmission rates effective January 2001 were fair and legitimate. A decision from the Régie is expected in the first quarter of 2002. Until the new rates are approved, the effective rates will be those decreed by the Québec government in March 1997.

To ensure business development, Hydro-Québec TransÉnergie is on the lookout for new opportunities on international markets. We were able to capitalize on a number of significant opportunities because of, among other things, global recognition of our high-voltage power transmission know-how. In 2001, considerable business was generated in South America through the activities of Transelec (Chile) and Consorcio TransMantaro S.A. (Peru), as well as in Australia through our merchant line project, DirectLink. As at December 31, 2001, international assets accounted for \$2 billion or 11% of total assets of \$18 billion.

Growth in Revenue

Sales topped \$3 billion, for a total of \$3,028 million compared with \$2,776 million in 2000, an increase of \$252 million or 9%, primarily due to international activities. In 2001, net income reached \$436 million, up \$37 million or 9% over the previous year.

Our revenue from regulated transmission operations showed no change, as the rates are still those set by the 1997 decree. Most of our revenue came from Hydro-Québec Distribution and was related to the transmission requirements of Québec customers.

The strong growth in international sales compared with 2000 was due, in particular, to the inclusion in 2001 of the results of Transelec, the largest power transmission company in Chile. Transelec was acquired through Hydro-Québec International in the fourth quarter of 2000. It had sales totaling \$205 million, and accounted for over 82% of all foreign sales.

Total expenditure amounted to \$2,592 million, up \$215 million or 9%. The inclusion of foreign transmission operations accounts for \$197 million of this increase.

Short-term contracts and trading	20.0	■
Long-term contracts	1.9	■

GENERATION

In addition to guaranteeing the supply of heritage pool electricity to the Québec market, Hydro-Québec Production, our generating division, is an active player on the regional energy markets in the northeastern part of the continent. Its activities are focused on selling surplus electricity generated in Québec, purchasing electricity for resale and conducting price arbitraging. In 2001, Hydro-Québec Production took advantage of favorable terms on the markets, which enabled it to achieve sales of \$3 billion outside Québec.

The segment's net income amounted to \$1.2 billion in 2001, down \$83 million from 2000. This drop was mainly due to a 7.1-TWh decrease in sales of Québec-generated electricity on U.S. markets in 2001. However, this decrease in volume was partially offset by better selling prices.

Sales topped \$7 billion for the first time. Revenue was up \$695 million from 2000, totaling \$7,309 million. This growth was mainly due to an increase in selling prices and energy trading volumes on U.S. markets.

Electricity Sales to Hydro-Québec Distribution

Electricity sales to this division amounted to \$151.9 TWh or \$4.1 billion in 2001 and accounted for 56% of revenue and 78% of total sales. Sales saw very little change compared with 2000. Weather and economic conditions put a damper on expected growth in this market.

Sales to Hydro-Québec Distribution are conducted according to the terms and conditions established by the Québec government in 2000, namely a fixed price of 2.79 cents per kilowatthour, which is adjusted to take certain contracts into account.

Electricity Sales Outside Québec

Since the opening of wholesale markets to competition, electricity sales outside Québec have grown significantly from \$0.6 billion in 1997 to over \$3 billion in 2001. They reached 42.4 TWh in 2001, representing \$3.1 billion in revenue, up \$733 million from the preceding year. Of these sales, 32.2 TWh were in connection with energy trading on U.S. markets and 10.2 TWh with sales of Québec-generated electricity on markets outside Québec, mainly in the U.S. Northeast.

Lastly, we continue to assert our presence on international markets. Activities carried out through our foreign interests, primarily in Panama, yielded \$38 million in electricity sales this year, up \$7 million over 2000.

Electricity and Fuel Purchased

Electricity and fuel purchases rose from \$1.8 billion to \$2.7 billion, up \$902 million or 49%. Short-term electricity purchases directly related to energy trading transactions outside Québec were almost entirely responsible for this growth.

generation

growth, performance and reliability

ENGINEERING, PROCUREMENT AND CONSTRUCTION

Hydro-Québec Ingénierie, approvisionnement et construction, our engineering, procurement and construction division, carried out activities valued at \$1.2 billion in 2001, comprising \$0.5 billion in shared services and \$0.7 billion in engineering and construction projects. Shared services are those offered to other divisions of the Corporation and encompass, among other things, procurement, information technology, building management and ground and air transportation services.

Activities related to shared services increased slightly by 1.4%, mainly due to the growing needs of internal customers.

Activities related to engineering and construction projects reached \$0.7 billion in 2001, compared with \$0.9 billion in 2000. A delay in obtaining government authorizations caused us to postpone work on the transmission grid loop projects in the Montérégie and Outaouais regions, as well as construction of an interconnection with the Ontario grid. Nevertheless, the division posted an increase in generation projects and undertook draft design studies for the construction of retaining structures (Lake Kénogami), new hydroelectric generating stations (Romaine-1, Péribonka, etc.) and refurbishment work on several generating facilities in Québec (Beauharnois, Bersimis-1, Shawinigan-2, etc.).

engineering, procurement and construction

expertise focused on performance and profitability

OTHER

In 2001, the Other segment recorded a net loss of \$28 million, compared with a loss of \$101 million the previous year. This improvement stemmed largely from the periodic review of our R&D portfolio, conducted in 2000.

In order to pursue development of the rechargeable lithium-metal-polymer battery technology, Hydro-Québec formed a partnership in 2001 with a U.S. firm. The new partners plan to market the batteries to telecommunications companies, automotive manufacturers and power utilities. As a result of the partnership, the ACEP battery technology was transferred to the AVESTOR limited partnership, and development activities to enhance the technology were stepped up, resulting in higher expenses during the year.

Hydro-Québec CapiTech, which makes venture capital investments in energy technology, ended 2001 with a \$7 million loss, \$1 million more than in 2000. Although Hydro-Québec CapiTech recorded gains when investments were disposed of early in the year, deteriorating economic conditions throughout 2001 dragged down the value of certain holdings in its portfolio.

However, our interest in Noverco generated net income of \$27 million in 2001, up \$7 million over the previous year, due to Enbridge's improved operating results.

Finally, a \$7 million gain in the first quarter on the sale of part of our stake in the telecommunications company Connexim helped improve net income for this segment.

* The Corporation holds purchase options on an additional 9.2% of the shares.

Financial Position

Self-Financing Ratio

Investments by Type of Activity

* Excludes \$136 million (\$690 million in 2000) corresponding to the Corporation's investment in its interests.

** Includes eliminations for consolidation purposes.

OPERATING ACTIVITIES

For 2001, operating activities generated cash of \$3,463 million, up \$183 million or 5.6% over 2000. The cash generated during the year was used to finance Hydro-Québec's investment program and repay short-term borrowings. The self-financing ratio stood at 54.6% in 2001, an increase of 12.1% over the previous year. In 2000, the \$1.6-billion acquisition of Transelec had brought down the self-financing ratio.

INVESTING ACTIVITIES

In 2001, overall investments totaled \$1,878 million, down \$1,612 million or 46% from the preceding year. This decrease stemmed primarily from the major investment made by Hydro-Québec in 2000, through Hydro-Québec International (HQI), to acquire Transelec, Chile's largest power transmission company.

Investment activities fall into three categories: ongoing operations, development activities, and Hydro-Québec's interests. Ongoing operations encompass amounts invested in the normal course of the Corporation's business. This year, we invested \$1,555 million, mainly to ensure long-term operability and meet domestic demand. Development activities, which totaled \$106 million in 2001, comprised Hydro-Québec's investments in business and technological development as well as those related to international activities. Investments made through Hydro-Québec's interests, for all segments combined, totaled \$217 million and were concentrated primarily in the Transmission segment and in natural gas (under Other).

Much of the spending on energy-related construction projects by the Hydro-Québec divisions is carried out by Hydro-Québec Ingénierie, approvisionnement et construction, the Corporation's engineering, procurement and construction division. In 2001, investment was mostly in the Transmission and Generation segments, and was focused on major generating station refurbishment, construction of new facilities, transmission network reinforcement and hydroelectric capacity development.

Distribution

In 2001, we invested \$455 million to continue ongoing activities in the Distribution segment, \$151 million of which was allocated for the renewal of aging or inadequate distribution grid equipment in order to accommodate a larger electrical load.

To satisfy growing customer demand, we also injected \$120 million into projects to ensure power supply to customers, including system extensions to connect new customers.

Ongoing Operations

(%)

Transmission

We invested \$477 million in the Transmission segment's ongoing operations in 2001. To ensure long-term operability, we continued investing in the Beauharnois generating station rehabilitation project. In 2001, \$31 million was allocated primarily for network integration of the new switchyard west of the generating station and initial construction work on a substation east of the facility.

In addition, to prolong the service life and improve the reliability of transmission grid equipment, we spent \$116 million on transformer and switchgear work. Similarly, we spent \$9 million out of a total investment of \$64 million in 2001 to finish upgrading the hardware and software of the System Control Centre (SCC), which was commissioned during the year.

The Corporation also invested \$9 million in the Toulustouc project. The work began in 2001 with construction of the 69-kV line needed to supply power to the work site.

Through our subsidiary HQI, we spent \$105 million to pursue and expand our international activities in Chile, Peru and Australia. These investments are part of Hydro-Québec TransÉnergie's international strategy and are intended to promote its technology expertise in high-voltage power transmission. Of these funds, \$95 million was injected into our Chilean subsidiary Transelec to readjust its capital structure, among other things.

Investments made through Hydro-Québec interests reached \$64 million in 2001 and mainly comprised fixed assets. Of this amount, \$41 million was spent on international activities, through Hydro-Québec's interests in Chile, Peru and Australia. TransÉnergie HQ's American subsidiary, TransÉnergie U.S., continues to capitalize on its technical know-how to develop merchant line projects, in which the pricing is exclusively market-based. The subsidiary thus spent \$17 million on fixed assets for construction work on a high-voltage direct-current underwater interconnector, the Cross Sound Cable. This merchant line will connect the Connecticut and Long Island, N.Y., power grids and will improve power supply in the area.

Generation

In the Generation segment, \$562 million was invested in ongoing operations, including \$300 million to ensure long-term operability of the generating plant.

One of the most important projects in this segment is construction of the new Grand-Mère hydroelectric facility, which began in 2000 and will continue until the end of 2004. In 2001, \$74 million went to perform major excavation work and complete 30% of the concrete work on the generating station, water intake and main spillway.

The segment's other large projects share a common goal of ensuring long-term operability and consist of generating station rehabilitation and refurbishment work, for which investments totaled \$100 million. The projects are aimed at modernizing existing generating facilities, maintaining their performance, and extending their useful lives. In particular, \$40 million was spent on rehabilitation of Beauharnois generating station, primarily to refurbish and modernize the generating units and refurbish and reinforce the main powerhouse structure.

Other	32	13

* Includes \$136 million corresponding to the Corporation's investment in its interests.

The Sainte-Marguerite-3 generating station project received \$234 million in 2001 and will enable us to meet growing demand in all markets. Construction and equipment installation were completed during the year, and the tests and inspections necessary to commission the generating units began according to the plan established at the start of the year. Commissioning of the facilities was delayed due to technical problems encountered when the headrace tunnel was filled with water.

Development activities include construction of a 526-MW hydroelectric generating station on the Toulnostouc River. We have met the Québec and Canadian government environmental criteria and, in 2001, received the necessary government authorizations to carry out the work. The new project, at a cost of some \$800 million, will be implemented over the next few years, and commissioning is scheduled for 2005. In 2001, we invested \$56 million in this project to cover, in particular, the draft design studies, the partnership agreements with the First Nations communities and the initial road rehabilitation and headrace tunnel excavation work.

Engineering, Procurement and Construction and Other

The EPC segment invested \$20 million to ensure long-term operability and, more specifically, implement a new version of its integrated management software package.

Under Other, the Corporation invested \$32 million in development activities, including \$28 million in the form of capitalization of Hydro-Québec CapiTech, which provides the Corporation with commercial and technological intelligence through its venture capital activities. Hydro-Québec CapiTech manages energy-related venture capital funds and directly invests in companies that develop and market technologies likely to contribute to the growth of the Corporation's divisions.

In addition, a \$164-million interest in Hydro-Québec IndusTech resulted from the transfer of lithium-metal-polymer battery technology to AVESTOR, the joint venture created in 2001. The investment did not entail an outflow of cash during the year because it constituted recognition of the value of research conducted in the field over the past years.

Lastly, a total of \$182 million was invested through Hydro-Québec's interests in 2001, excluding \$53 million associated with inflows from investment disposals made during the year. Most of this amount, \$129 million, is our share of investments by Gaz Métropolitain and Company, Limited Partnership (GMCLP), held through Noverco. GMCLP's investments primarily covered fixed assets and deferred expenses related to natural gas costs, in particular transportation and storage. These costs can be recovered from customers by means of an automatic rate recovery mechanism approved by the Régie de l'énergie. Furthermore, in 2001 Hydro-Québec CapiTech invested \$38 million in capital ventures.

Change in the Corporation's Long-Term Financing

FINANCING ACTIVITIES

Financing the Corporation

The 2001 borrowing program was one of the largest in recent years, due mainly to the higher volume of maturing debt. The Corporation raised a total of \$3,354 million on the markets, compared with an average of \$2 billion for the preceding years. It completed 87% of its initial program, which anticipated borrowings of \$3,877 million. In addition, the US\$376 million short-term loan incurred as part of temporary financing for the fall 2000 acquisition of Transelec was repaid. The Corporation also paid down its long-term debt by approximately \$385 million, the third net repayment in as many years.

The Corporation was again guided in its financing decisions by a policy of securing its cash requirements at the lowest possible cost and reducing the funding risk. The attainment of these objectives must be coordinated with the diversification of funding sources and rigorous hedging of exchange risk exposure.

Once again, the lowest costs were found on the Canadian market. Most of our financing transactions—66%—were therefore carried out in Canada. Financing activities were particularly intense early in the year, as more than one-third of debt matured in the first quarter. Close to \$1 billion was borrowed in January on the Canadian medium-term note market. These issues proved popular with the various groups of investors.

In late January, we successfully reopened a bond issue bearing 6.5% interest, launched in 2000, in order to increase the amount outstanding by \$500 million. The nominal value of the series, which matures in 2011, consequently rose to \$1.3 billion.

We also capitalized on narrower credit spreads between U.S. and Québec government bond yields to issue U.S. dollar-denominated debt for the first time since 1996. A US\$750-million issue, maturing in 10 years and bearing 6.3% interest, was floated on the global market. The issue was greeted positively, particularly by U.S. investors, who made up the majority of buyers. Because of our participation in the U.S. market, we were able to diversify our investor base and ensure that our involvement in the Canadian market would be less frequent and meet with a more enthusiastic response.

The remainder of our financing transactions consisted of medium-term notes that were strategically issued over the course of the year. Most of these notes mature between 2004 and 2006.

Finally, the Corporation has access to the following preauthorized funding sources:

Type of financing	Authorized volume	Market	Outstanding at December 31, 2001
Credit	US\$350M or equivalent in C\$	Canada	–
	C\$65M	Canada	–
	US\$50M	United States	–
Standby credit	US\$1,500M	Eurodollar	–
Commercial paper	US\$2,250M or equivalent in C\$	United States	
		Canada	\$42M

Credit Ratings

The following table summarizes the Corporation's credit ratings:

	2001	2000
U.S. agencies		
Moody's	A1	A2
Fitch Ratings	AA-	AA-
Standard & Poor's	A+	A+
Canadian agency		
DBRS	A	A

In 2001, Moody's, the New York credit rating agency, raised the credit rating of the Province of Québec and, consequently, Hydro-Québec from A2 to A1. The agency was motivated in its decision by the province's improved fiscal situation, zero budget deficit and lower accumulated debt, among other factors.

Financing the Corporation's Interests

In terms of the Corporation's interests, the highlight was undoubtedly the long-term refinancing of Transelec, which consisted of a US\$465M loan maturing in 10 years and bearing 7.875% interest, and a loan on local markets in the amount of 9.2 million indexed Chilean pesos, or approximately US\$242 million, bearing 6.2% interest. This financing transaction earned Hydro-Québec International the Deal of the Year Award from Latin Finance magazine, published by the Euromoney group.

Dividends, Capitalization and Interest Coverage

With a year-end capitalization rate of 27.5%, Hydro-Québec declared dividends of \$554 million, or 50% of net income. After the dividends were paid to the shareholder, the capitalization rate stood at 26.8%, compared with 26.2% in 2000.

Moreover, the decrease in financial expenses significantly improved Hydro-Québec's interest coverage, from 1.37 times interest expense in 2000 to 1.43 in 2001.

UNITS OF MEASURE

\$M	millions of dollars
\$B	billions of dollars
kW	kilowatt (one thousand watts)
MW	megawatt (one million watts)
GW	gigawatt (one million kilowatts)
GWh	gigawatthour (one million kilowatthours)
TWh	terawatthour (one billion kilowatthours)
